Chapter 1

Introduction

AdriaticGo is a digital platform project focused on developing an on-demand food delivery system for the city of Koper. The platform connects customers, restaurants, and couriers in a single application that enables food ordering, secure payments, and real-time delivery coordination.

The project responds to the increasing demand for convenient mobile ordering while helping local restaurants that do not have their own delivery or digital systems.

The final result of this project is a fully functional Minimum Viable Product (MVP) ready for launch and initial operation.

The main goal of AdriaticGo is to provide:

- Simple and fast food ordering
- Real-time order tracking
- Secure payment processing
- Affordable digitalization for local restaurants
- Flexible work opportunities for couriers

Chapter 2

Project Charter

2.1 Project Objectives

Final Implementation Deadline: 1 June 2026

The platform must:

- Support four user roles: customers, restaurants, couriers, and administrators
- Enable secure registration and authentication
- Provide encrypted data transmission
- Integrate online payment processing
- Provide real-time order tracking
- Include administrative dashboard functionality
- Ensure GDPR compliance

2.2 Project Scope

Included in Scope

- System architecture design
- Backend and database development
- Frontend web/mobile interface development
- Payment gateway integration
- Cloud infrastructure deployment

- Functional, security, and performance testing
- Pilot launch within Koper

Scope Exclusions

- Geographic expansion beyond Koper
- Large-scale marketing campaigns
- Advanced logistics optimization algorithms

2.3 Phased Delivery Plan

Phase 1 – Planning and Architecture (March 2026)

- Requirements gathering
- System design documentation

Phase 2 – Core Development (April 2026)

- Backend services
- Database implementation
- Frontend prototype

Phase 3 – Integration and Testing (May 2026)

- Payment integration
- Security testing
- Performance testing
- Pilot deployment preparation

Final Launch: 1 June 2026

2.4 Resources

Financial Resources

Total approved budget: €80,000

Allocated for:

- Development and technical implementation
- Cloud hosting services
- Security and compliance validation
- Integration services
- Contingency reserve (10%)

In-Kind Resources

- Internal development team expertise
- Existing company IT infrastructure
- Project management oversight
- Pilot restaurant participation

2.5 Project Team

- Leonardo Postolov – 89231064
- Nikola Murgovski – 89221036
- Teodor Veskovski – 89221008
- Vuk Mičić – 89221026
- Djordje Banovčanin – 89221012

The team is responsible for system development, integration, testing, documentation, and deployment readiness.

2.6 Constraints, Assumptions and Risks

Constraints

- Fixed deadline: 1 June 2026
- Budget cap: €80,000
- GDPR compliance requirements

Assumptions

- Availability of payment gateway providers
- Participation of pilot restaurants
- Cloud infrastructure reliability

Risks

- Development delays
- Security vulnerabilities
- Budget overruns
- Lower-than-expected market adoption

2.7 Approval

This charter formally authorizes the execution of the AdriaticGo Project.

Approved by: Maria Kovac, Chief Operations Officer

Approval Date: 15 February 2026

Chapter 3

Personas and Problem Scenarios

This chapter presents the target users of the AdriaticGo platform.

3.1 Nika the Busy Professional

Function: Primary End-User – Customer Ordering Food

Screening Question:

"How many times per week do you order food for delivery in Koper using an app or by phone?"

Description

Nika is a 29-year-old project coordinator working in Koper. She has long workdays and values convenience and efficiency. She orders food 3–4 times per week and expects fast ordering, secure payment, and real-time tracking. If the experience is slow or unclear, she quickly switches platforms.

Thinks

- “Why is ordering food here more complicated than it should be?”
- “I just want something reliable that works every time.”

Sees

- Different restaurants using different systems
- Some restaurants only accepting phone calls
- Inconsistent delivery times

Feels

- Impatient when tracking is unavailable
- Frustrated when calling restaurants is required
- Relieved when ordering is simple and efficient

Does

- Orders food 3–4 times per week
- Pays online whenever possible
- Checks reviews before ordering
- Switches platforms quickly if dissatisfied

Problem Scenarios

Problem Scenario	Current Alternatives	AdriaticGo Value Proposition
After work, Nika wants dinner delivered quickly but her favorite local restaurant is not available on major platforms.	Calling the restaurant directly, using international delivery apps, or cooking at home.	AdriaticGo provides a centralized local platform in Koper where both popular and small local restaurants are available in one app.
Nika places an order but receives no real-time tracking updates.	Calling the restaurant or waiting without updates.	AdriaticGo shows real-time order status so customers always know where their food is.

3.2 Robert the Local Restaurant Owner

Function: Restaurant Partner – Caterer

Screening Question:

"Do you currently offer delivery, and if yes, how do you manage incoming orders?"

Description

Robert is a 48-year-old restaurant owner in Koper. He runs a Mediterranean restaurant and wants to expand delivery but avoids large platforms due to high commission fees. He needs digital ordering without sacrificing profitability.

Thinks

- "I need delivery to stay competitive."
- "But I do not want to lose revenue in commissions."

Sees

- Competitors partnering with large delivery platforms
- Young customers ordering through apps instead of calling

Feels

- Pressured by digital transformation
- Skeptical of expensive external platforms
- Concerned about profitability

Does

- Accepts phone orders manually
- Uses paper or basic POS systems
- Sometimes hires part-time delivery drivers
- Avoids long-term contracts with major platforms

Problem Scenarios

Problem Scenario	Current Alternatives	AdriaticGo Value Proposition
Robert wants to offer digital ordering but cannot justify high commission fees.	Staying phone-order only, hiring own delivery staff, or partnering with expensive global platforms.	AdriaticGo provides affordable commission rates for local restaurants.
During peak hours, phone orders overwhelm staff, causing delays and mistakes.	Hiring extra staff, accepting fewer orders, or managing orders manually.	AdriaticGo centralizes digital orders in one dashboard, reducing phone calls and mistakes.

3.3 Oscar the Student Courier

Function: Courier – Delivery Partner

Screening Question:

"Have you worked as a courier or delivery driver in the last six months?"

Description

Oscar is a 22-year-old university student in Koper looking for flexible part-time income. He owns a scooter and prefers choosing his own working hours. He values transparent earnings and clear delivery instructions.

Thinks

- "I need something flexible around my classes."
- "I do not want to guess how much I will earn."

Sees

- Friends working for international delivery platforms
- Mixed reviews about pay transparency

Feels

- Motivated by independence
- Frustrated if compensation is unclear
- Stressed when delivery instructions are incomplete

Does

- Works part-time 10–15 hours per week
- Uses Google Maps constantly
- Prefers digital payments
- Tracks earnings weekly

Problem Scenarios

Problem Scenario	Current Alternatives	AdriaticGo Value Proposition
Oscar cannot clearly see how much he has earned or how bonuses are calculated.	Manually tracking earnings, waiting for monthly summaries, or switching platforms.	AdriaticGo provides a transparent earnings dashboard with real-time income tracking and clear bonus rules.
Oscar receives incomplete delivery instructions and must call customers repeatedly.	Calling customers, messaging via third-party apps, or delaying deliveries.	AdriaticGo provides clear delivery instructions and in-app communication.

Chapter 4

User Stories and Test Case Decomposition

This chapter transforms the identified personas into functional software requirements through user stories, epics, and test case decomposition.

4.1 Persona 1: Nika the Customer (End-User)

Epic 1: Centralized Local Selection

User Story:

As a customer, I want to access a single app that lists both major chains and small local boutiques, so that I do not have to check multiple social media pages to find dinner.

Test Cases

- Verify that searching for “Koper Local” displays restaurants that do not have their own standalone websites.
- Confirm the “Order” button remains active for “Facebook-only” partners during their specified operating hours.

Epic 2: Time-Efficiency and Tracking

User Story:

As a customer, I want to see the real-time status of my order, so that I can manage my work schedule and know exactly when to meet the courier.

Test Cases

- Verify the status transitions from “Kitchen” to “With Courier” via a push notification.
- Confirm the live map shows the courier’s movement.

Epic 3: Frictionless Checkout

User Story:

As a customer, I want to pay securely via a saved card, so that I can avoid the hassle of finding cash or calling the restaurant.

Test Cases

- Check that the “Express Checkout” completes the transaction in under three taps.
- Ensure payment error messages provide specific troubleshooting instead of generic errors.

4.2 Persona 2: Robert the Restaurant Owner

Epic 1: Profit Margin Protection

User Story:

As a restaurant owner, I want to see a clear breakdown of platform fees per order, so that I can ensure the service is more affordable than global platforms.

Test Cases

- Verify the “Order Details” view subtracts the commission accurately before showing the merchant net payout.
- Confirm that daily totals in the dashboard match the sum of individual net payouts.

Epic 2: Operational Streamlining

User Story:

As a restaurant owner, I want to receive all digital orders on one screen, so that I can reduce phone call interruptions for my staff.

Test Cases

- Verify that a new order arrival forces the dashboard notification and alert sound until acknowledged.
- Test the “Busy Mode” toggle to verify estimated preparation adjustments.

Epic 3: Hybrid Logistics Support

User Story:

As a restaurant owner, I want to request a platform courier only when my own drivers are busy, so that I can handle spikes in demand without hiring more staff.

Test Cases

- Verify the courier assignment button is disabled if no couriers are nearby.
- Confirm order hand-off triggers status updates for the customer.

4.3 Persona 3: Oscar the Courier

Epic 1: Earnings Transparency

User Story:

As a student courier, I want to see my earnings and bonuses updated instantly after each delivery, so that I can track my income toward weekly goals.

Test Cases

- Verify the earnings counter updates immediately after delivery completion.
- Check that the bonus multiplier is visible before accepting an order.

Epic 2: Navigation Precision

User Story:

As a student courier, I want to receive exact coordinates and building codes in the app, so that I can avoid calling customers for directions.

Test Cases

- Verify that clicking the address opens integrated navigation with the exact pin.
- Confirm that building entry codes are displayed clearly on the delivery screen.

Epic 3: Schedule Flexibility

User Story:

As a student courier, I want to toggle my status to offline instantly, so that I can stop receiving orders when university classes start.

Test Cases

- Ensure the offline switch cannot be toggled during active deliveries.
- Confirm that no new orders are sent after a courier goes offline.

Chapter 5

Hypothesis Testing

This chapter presents the hypothesis validation process conducted through interviews with different stakeholder groups related to the AdriaticGo platform.

5.1 User Interviews

5.1.1 Persona 1: The Courier

Interviewee: Dimitrije B., Wolt worker

Hypothesis 3.1: Instant Earnings Updates

- **Q1: Satisfaction with current earnings tracking?** Somewhat satisfied, but updates are often delayed or unclear.
- **Q2: Experienced lack of pay transparency?** Yes, bonuses, tips, or distance adjustments mostly.
- **Q3: Importance of immediate earnings view?** Very important.
- **Q4: Would real-time updates encourage switching?** Yes, it would make the app more trustworthy.
- **Q5: Impact on road motivation?** It would help me decide whether to keep working longer or stop.

Hypothesis 3.2: Optimal Coordinates & Productivity

- **Q1: Time lost finding hidden entrances?** Depends; sometimes none, but others 5+ minutes.
- **Q2: Biggest frustration with current mapping?** Incorrect pins or customers not providing clear location details.
- **Q3: Impact of optimized coordinate pins?** It would save time and reduce stress, making the job easier.
- **Q4: Does speed equal higher earnings?** Yes, faster deliveries mean more money.
- **Q5: Switch for better drop-off accuracy?** Possibly, depending if the pay is also competitive.

Hypothesis 3.3: Flexible Online/Offline Status

- **Q1: Feeling of schedule control?** Moderate control, but some apps require scheduled blocks.
- **Q2: Penalized for sudden offline status?** Yes, it has happened before.
- **Q3: Importance of consequence-free toggling?** Very important.
- **Q4: Preference for 100% flexibility?** Yes, definitely, though competitive pay is required.
- **Q5: Biggest scheduling inconvenience?** Required shift blocks. Allowing drivers to go online anytime without penalties would be awesome.

5.1.2 Persona 2: The Customer

Interviewee: Matij A., Frequent App User

Hypothesis 1.1: Local Selection vs. Mainstream Apps

- **Q1: Frustration with restaurant selection?** Seeing the same places over and over; small local spots are hard to find.
- **Q2: Recall missing a niche spot?** Yes, a local burger place was missing; I had to call directly or order elsewhere.
- **Q3: Importance of having chains and local spots?** It is pretty important to have both in the exact same app.
- **Q4: Likelihood to switch for better local selection?** I would be pretty open to switching or at least trying it.
- **Q5: Number one selection feature?** A wider variety of genuinely local restaurants not found on the big apps.

Hypothesis 1.2: Excellent Tracking & Time Optimization

- **Q1: Accuracy of current delivery tracking?** Honestly, it is hit or miss. Sometimes it says “almost there” then I wait 20 mins.
- **Q2: Story of tracking inconvenience?** App showed driver close, so I waited by the door, but food took 15 more minutes.
- **Q3: Value of real-time tracking?** I would value that a lot; it makes the experience less stressful.
- **Q4: Is tracking enough to switch apps?** Yes, if food and price were equal, better tracking gives the app an advantage.
- **Q5: Impact of arrival time on productivity?** If I know exactly when it comes, I can time my breaks better and stay focused.

Hypothesis 1.3: Fully Optimized Payments

- **Q1: Most used payment method?** Debit or credit card because it is the fastest and most convenient.
- **Q2: Abandoned order due to payment method?** Yes, a few times when a specific method wasn't supported.
- **Q3: Feeling on alternative payments (Crypto/Cash)?** I would see that as a nice bonus; more flexibility is always good.
- **Q4: Does the checkout feel restrictive?** Sometimes; re-entering info or dealing with limited choices is frustrating.
- **Q5: Would crypto/direct banking make you switch?** Probably not alone, but it is a strong extra feature for reliability.

5.1.3 Persona 3: The Merchant (Business Owner)

Interviewee: Lazar J., Local Restaurant Owner

Hypothesis 2.1: Fees vs. User Base

- **Q1: View on current fee transparency?** They are quite opaque; hard to calculate actual profit per dish.
- **Q2: Fair commission percentage?** 12% to 15% is the maximum I consider sustainable.
- **Q3: Join with smaller base for lower fees?** Yes, I would test it if the margins were better.
- **Q4: Impact of fees on profitability?** Significant; it forces us to raise prices on apps by 20%.
- **Q5: Convincing fee structure?** A flat monthly subscription or a capped commission rate.

Hypothesis 2.2: Time/Productivity Optimization

- **Q1: Staff time spent on tablets?** About 1–2 hours of cumulative labor per shift for the staff.
- **Q2: Current workflow disruptions?** Multiple tablets ringing and manual data entry cause errors and delays.
- **Q3: Value of zero-entry integration?** Extremely valuable; it allows staff to focus on guests.
- **Q4: Paused service during rush?** Yes, frequently when managing tablets becomes too overwhelming for the team.
- **Q5: Minimize interaction as a reason to adopt?** Yes, efficiency is just as important as the commission rate.

Hypothesis 2.3: Hybrid Courier Model

- **Q1: Own drivers or 3rd party?** We rely entirely on 3rd parties as fleet management is too expensive for us.
- **Q2: Handling surges in orders?** We increase estimated wait times, which results in colder food.
- **Q3: Appeal of hybrid model?** This would be the “holy grail” for balancing control and cost.
- **Q4: Logistics pain points?** Vehicle maintenance and paying drivers during slow idle hours.
- **Q5: Safety net as a reason to sign up?** Absolutely; it removes the risk of hiring in-house staff.

5.2 Prototype Improvements

Based on the conclusions from the interviews, we identified that localized selection is the primary driver for customer acquisition. Consequently, we decided to improve our system around **localized delivery**.

Our solution includes a new **Community Recommendation System**. This feature allows users to recommend a local or niche restaurant that is not currently on the platform. If the recommended restaurant successfully joins the app, the referring user is rewarded with a **bonus coupon** for their next order. This creates a viral growth loop that ensures our platform offers a superior selection of unique local eateries compared to mainstream competitors.

Prototype Link:

<https://adriaticgofinal.vercel.app/>

Chapter 6

Usability Testing

This chapter presents the usability testing process conducted for the AdriaticGo platform prototype. The goal of the testing was to evaluate the user experience, identify usability issues, and collect direct participant feedback regarding the ordering workflow.

6.1 Usability Testing

Tasks

1. Open site and find Mediterranean restaurants in Koper
2. Select a restaurant and view the menu
3. Add several items to the cart
4. Proceed toward checkout
5. Place the order

Participants

- Jana Popovska
- Davor Andonovski
- Filip Murgovski

6.1.1 Participant 1: Jana, 22

- Task 1: 15s, confused where the filter is located
- Task 2: 10s
- Task 3: 15s
- Task 4: 25s, accidentally clicked on “My Orders” instead of “Cart”
- Task 5: 10s, easily executed

Problems

- Missing selection of options for each meal order

Most intuitive

- Placing the order

Comments

“Nice overall, you only need some additional options when ordering (ex. Food intolerances)”

Ease: 4/5

6.1.2 Participant 2: Davor, 21

- Task 1: 30s, didn't see the filter and search bar, so he manually searched for a Mediterranean restaurant
- Task 2: 45s, easily found
- Task 3: 25s
- Task 4: 35s, confused where the checkout is
- Task 5: 10s, easily executed

Problems

- No clear "Go to Checkout" button

Most intuitive

- Menu scrolling

Ease: 4.5/5

6.1.3 Participant 3: Filip, 34

- Task 1: 10s (quick search)
- Task 2: 30s, said that the menu is too long
- Task 3: 18s, easily executed
- Task 4: 28s, clicked the “Cart” button in the navbar
- Task 5: 20s, felt confused why everything is monotone

Problems

- Categories in menu are missing

Comments

“Everything looks cool, but make the UI more user friendly and popping, also add categories in the menus, so you don’t have to scroll the whole menu.”

Ease: 4/5

6.2 Usability Testing Results

Average Time Per Task

Task	Average Time
Find Mediterranean restaurants	18s
View menu	28s
Add items	19s
Go to checkout	29s
Place order	13s

Most Intuitive Tasks

- Placing order
- Menu scrolling

Key Problems Identified

- Filter/search location unclear
- No “Go to Checkout” button
- Missing meal customization (options, intolerances)
- No menu categories, causing long scrolling
- Monotone UI lacking visual contrast

Fixes Needed

- Prominent search/filter placement
- Clear “Checkout” button
- Add customization options per item
- Add menu categories
- Improve UI contrast and colors

Overall Ease

Average usability score: 4.2/5

The ordering flow was generally smooth and intuitive, but improvements are required in discoverability, navigation clarity, and interface visuals.

Chapter 7

Scrum Basics

This chapter presents the agile development structure, sprint planning process, and technical stack used during the implementation of the AdriaticGo platform.

7.1 Tech Stack

- Frontend: Next.js (React + TypeScript)
- Authentication: NextAuth (Auth.js)
- Database access layer: Prisma
- Database: PostgreSQL
- Styling: Tailwind CSS + shadcn/ui

7.2 Sprint 1 (March 22 – April 4)

- Initialize Next.js + TypeScript project
- Set up Prisma + PostgreSQL database connection
- Configure authentication for basic login/register
- Create homepage with search bar
- Build restaurant listing page with filters
- Create restaurant menu page
- Implement basic cart (add/remove items)
- Apply CSS styling

7.3 Sprint 2 (April 5 – April 18)

- Complete customer order flow
- Add checkout page
- Implement order creation in database

7.4 Sprint 3 (April 19 – May 2)

- Restaurant owner dashboard (order list)
- Courier mobile view (accept orders)
- Admin basic dashboard

7.5 Sprint 4 (May 3 – 16)

- Payment processing
- Notifications (email)

7.6 Sprint 5 (May 17 – 30)

- Polish User Experience based on usability feedback
- Performance and security testing
- Apply GDPR

7.7 Sprint 6 (Final)

Deployment and final fixes by 1 June.

Chapter 8

Stakeholder Analysis

This chapter identifies the primary stakeholders involved in the AdriaticGo project, their expectations, potential conflicts, and the planned response strategy from the project team.

8.1 FAMNIT (Project Funder)

Status: Positive

Expectations

Expects the fully functional Minimum Viable Product (MVP) to be delivered by the fixed deadline of 1 June 2026. The stakeholder also expects the project to remain within the approved budget cap of €80,000.

Possible Conflicts or Benefits

The primary benefit is the successful launch of a scalable solution that can later expand to other cities. Possible conflicts include budget overruns or development delays.

Team Response

Act in advance by providing regular progress reports at the end of each phased delivery (Planning, Core Development, Integration) to ensure visibility of all project risks.

8.2 Local Restaurants in Koper

Status: Positive

Expectations

They expect to benefit from a digital system and delivery network without having to build their own infrastructure.

Possible Conflicts or Benefits

The benefit to these stakeholders is meeting the increasing demand for convenient mobile ordering. A possible conflict is low market adoption or technical difficulties during the pilot launch.

Team Response

Gather requirements directly from restaurant owners during Phase 1 and prepare them thoroughly for the pilot deployment in Phase 3.

8.3 Customers

Status: Positive

Expectations

They expect convenient mobile ordering, secure payments, and real-time order tracking.

Possible Conflicts or Benefits

The benefit is a convenient local food delivery option. Conflicts could arise if the app suffers from security vulnerabilities or if real-time tracking fails.

Team Response

Act in advance with rigorous functional, security, and performance testing during Phase 3 to ensure a high-quality user experience.

8.4 Couriers

Status: Positive/Neutral

Expectations

They expect a reliable application that enables real-time delivery coordination.

Possible Conflicts or Benefits

The benefit is clear coordination for their delivery tasks. Conflicts may occur if the app's real-time coordination lags or crashes.

Team Response

Gather feedback during the pilot launch in Koper to refine the courier interface before future expansion.

8.5 Payment Gateway & Cloud Infrastructure Providers

Status: Neutral

Expectations

Expect successful integration with their APIs and reliable use of their cloud hosting services.

Possible Conflicts or Benefits

The benefit is steady business from the allocated budget. Conflicts or risks include integration failures or lack of cloud infrastructure reliability.

Team Response

Assume the availability of these providers and perform integration and testing in May 2026 to identify any technical issues.

8.6 Data Protection Regulators

Status: Neutral

Expectations

Expect the platform to maintain strict GDPR compliance and utilize encrypted data transmission.

Possible Conflicts or Benefits

Conflicts could result in regulatory action if security vulnerabilities compromise user data.

Team Response

Act in advance by factoring GDPR compliance into the system architecture design in Phase 1 and performing security testing in Phase 3.

8.7 Other Delivery Platforms

Status: Negative

Expectations

They expect to maintain their own market share and likely hope AdriaticGo experiences lower-than-expected market adoption.

Possible Conflicts or Benefits

The success of AdriaticGo presents a direct competitive threat to their market dominance.

Team Response

Act in advance by ensuring the MVP is fully functional, secure, and highly tailored to Koper's local restaurant ecosystem in order to establish a competitive advantage before launch.

Chapter 9

Engineering Leadership Patterns

This chapter explains positive engineering leadership practices that support the successful delivery of AdriaticGo, as well as anti-patterns that must be avoided during project execution.

9.1 Positive Patterns for AdriaticGo

9.1.1 Remove roadblocks

A leader's job is to clear the path so the engineering team can focus entirely on technical execution without interruptions.

Implementation in AdriaticGo

The project has a very tight timeline with a hard deadline of 1 June 2026. During Phase 2 (Core Development), the team will be busy building the application. The project lead must proactively ensure that third-party accounts (like cloud hosting and payment gateway providers) are approved, funded from the €80,000 budget, and accessible before the developers actually need them. If a cloud service goes down or a payment API key is delayed, the leader must step in immediately to solve it.

9.1.2 Set clear goals

Providing the team with unambiguous targets so everyone knows exactly what the team's goal and priorities are.

Implementation in AdriaticGo

The project scope is strictly limited to Koper and excludes advanced logistics or broad marketing. The leader must enforce these boundaries. By setting clear goals tied to the delivery plan, such as ensuring the system architecture design is fully documented by the end of March, the team stays aligned. This prevents scope creep and ensures the MVP meets the core requirement of supporting the four user roles (customers, restaurants, couriers, admins) without getting distracted by unnecessary features.

9.1.3 Be a teacher and a mentor

Fostering an environment of continuous learning and mutual support rather than just giving orders.

Implementation in AdriaticGo

Since the platform requires strict GDPR compliance and encrypted data transmission, team members with more experience in cybersecurity should actively mentor the others during Phase 3 (Integration and Testing). Utilizing advanced techniques during the security and performance testing phase will elevate the whole team's skill set and reduce the risk of critical security vulnerabilities.

9.2 Negative Patterns (Anti-Patterns) to Avoid

9.2.1 Micromanagement (The “Dictator” Pattern)

Dictating exactly how a task should be done rather than explaining what needs to be accomplished, stripping the engineering team of their autonomy.

Implementation (How to avoid it in AdriaticGo)

Having a capable development team of five, instead of the leader designing the database schema and forcing the team to type it out, the leader should assign the objective. Trust the internal development team's expertise to make the right architectural choices during Phase 1, intervening only if the design threatens the €80,000 budget cap or the timeline.

9.2.2 Ignoring Technical Debt (The “Feature Factory” Pattern)

Prioritizing speed and new features over code quality, leading to a fragile, unmaintainable codebase.

Implementation (How to avoid it in AdriaticGo)

The pressure to deliver the MVP by 1 June 2026 is high, which naturally introduces the risk of development delays. A poor leader would force the team to skip Phase 3 (Testing) to launch faster. To avoid this negative pattern, the leadership must protect the schedule allocated for Phase 3. No matter how much pressure there is to launch the pilot, functional, security, and performance testing must be completed to prevent the platform from crashing when real restaurants and couriers start using it.

Chapter 10

Assessment of Team Contributions and Application Showcase

This section evaluates the primary responsibilities and work contributions of each team member throughout the project lifecycle.

Team Member	Primary Responsibilities
Leonardo Postolov	Project coordination, backend development, documentation integration
Nikola Murgovski	Frontend implementation and UI design
Teodor Veskovski	Database implementation and testing
Vuk Mićić	Security implementation and cloud deployment
Djordje Banovčanin	Requirement analysis, QA testing

10.1 Default, Sign In and Sign Up Pages

Figure 10.1: Default Page of the AdriaticGo Application

The Sign In page features a header with the AdriaticGo logo, a 'Restaurants' link, and 'Sign in'/'Sign up' buttons. The main content area contains a central card with the title 'Welcome back' and the instruction 'Sign in to your AdriaticGo account'. The card includes input fields for 'Email' (with placeholder 'you@example.com') and 'Password'. A 'Sign in' button is positioned below these fields. A section titled 'OR TRY A DEMO ACCOUNT' follows, with three rows for 'Customer' (customer@demo.com), 'Restaurant Owner' (owner@demo.com), and 'Delivery Driver' (driver@demo.com). At the bottom of the card is a link for users who 'Don't have an account? Sign up'.

Figure 10.2: Sign In Page

The Sign Up page features a header with the AdriaticGo logo, a 'Restaurants' link, and 'Sign in'/'Sign up' buttons. The main content area contains a central card with the title 'Create an account' and the instruction 'Join AdriaticGo — food delivery in Koper'. The card includes input fields for 'Full name' (with placeholder 'Ana Novak'), 'Email' (with placeholder 'you@example.com'), and 'Password' (with placeholder 'At least 6 characters'). Below these is a section titled 'I am a...' with three radio button options: 'Customer' (selected, with subtext 'Order food from local restaurants'), 'Restaurant Owner' (with subtext 'Manage your restaurant and menu'), and 'Delivery Person' (with subtext 'Deliver orders around Koper'). A 'Create account' button is positioned below the options. At the bottom of the card is a link for users who 'Already have an account? Sign in'.

Chapter 11

Conclusion

The AdriaticGo project successfully demonstrated the development of a smart local delivery platform tailored for the city of Koper.

The project integrated:

- Project management principles
- Software engineering methodologies
- User-centered design
- Functional and security testing
- Real-world business analysis

The resulting MVP satisfies the core objectives defined in the project charter and provides a strong foundation for future expansion.

Future improvements may include:

- AI-based delivery optimization
- Expansion to additional cities
- Loyalty and recommendation systems
- Advanced analytics dashboards
